

LYNX Underquilt

When you first pull your down underquilt out of the box give it a good shake perpendicular to the baffles, shaking perpendicular to the baffles fluffs the down without moving it around. If you shake it in the direction of the baffles instead down may migrate and create empty spots. It should loft back up to 100% within 10 mins or so. After lots of use you may notice a gradual reduction in loft, this is normal. A few times a year or after a long trip you may wish to revive the loft, to do so put the quilt in the dryer on low or medium heat and include a few tennis balls and a wet washcloth (wring it out first). This should bring back all the loft. If you ever need to wash the quilt see the "care" section of our website for instruction. To install, clip the 4 micro-biners to the webbing loop that holds the hammock's corner buckles. make sure the logo patch on the quilt is at the head end of the hammock and the elastic tensioners on the quilt are at the foot end. Also see the Lynx setup video in our setup section. <http://warbonnetoutdoors.com/setup>
